

[DEPLYOMENT GUIDE FOR PERSONNEL SALES MANAGEMENT SYSTEM]

Prerequisites

- Windows Server or Windows machine
- Database: Microsoft SQL Server 2016 or above
- IIS installed (Enable in Turn On/Off Windows Features)
- .NET Hosting Bundle installed
- .NET Runtime 8.0 installed
- ASP.NET Core Runtime 8.0 installed
- Access to the published application files

Database Setup

1. Open SQL Server Management Studio.
2. Connect to the target SQL Server instance.
3. Open the SQL script file located in the SQL folder.
4. Execute the script SQLQueryScript.sql to create the database, tables, foreign key, and initial sample data.
5. Execute the script IIS_LOGIN_CREDENTIAL_SQL.sql to create the IIS App Pool credentials (if there aren't any credentials yet).
6. Confirm that the database PersonnelSalesManagementDb has been created successfully.

Update Connection String

1. In the published application files, open appsettings.json.
2. Update the connection string to match the target SQL Server instance.
3. Save the file.

```
"ConnectionStrings": {  
  "PersonnelSalesManagementConnectionString":  
    "Server=YOURSERVER\\SQLEXPRESS;Database=PersonnelSalesManagementDb;Tru  
sted_Connection=True;TrustServerCertificate=True"  
}
```

Deploy Application to IIS

1. Copy all files from the Deploy folder to the target server.
2. Place them in a folder such as(This will be the published application folder):
`C:\inetpub\wwwroot\PersonnelSalesManagement`
3. Ensure the folder have permission for full control in the folder properties >> security tab >>edit and enable the permissions.

Create IIS Site

1. Open IIS Manager.
2. Right click Sites and choose Add Website.
3. Enter site name: `_YOURSITENAME_`.
4. Set physical path to the published application folder.
5. Choose a port such as 8080.
6. Click OK.
7. Click Application Pools
8. Right click `_YOURPOOLNAME_` (usually same as site name) and choose Basic Settings.
9. Check pool name: `_YOURPOOLNAME_`
10. .NET CLR Version: No Managed Code
11. Click OK.

Application Requirements

1. Ensure ASP.NET Core Hosting Bundle is installed on the server.
2. Ensure IIS has permission to read the application folder.

Browse Application

1. Right click on `_YOURSITENAME_` and expand Manage Website and choose start.
2. Open browser.
3. Go to:
`http://localhost:8080`
